Category:	Installation / Migration	Estimated time:	0.00 hour
Target version:	3.0	Spent time:	0.00 hour
Complexity:	Normal	SCRUM pts - complexity:	?

Description

In the stylesheet section of Chamilo platform settings, add a themes selector, based on the directories available in main/template/ and affecting directly the constructor in main/inc/lib/template.lib.php to enable the selector there.

This would be the "default" theme.

Also add a theme filter, allowing you to define (in a textarea, one per line) a serie of User-Agents regular expressions to check for a specific device and trigger the use of a specific template.

These settings should all be changeable by multi-url.

The setting in template.lib.php would still be "default" by default (just in case we cannot connect to the database and have to print an error message).

This would be like:

- Default platform theme: default
 - This theme will be used for all users not matching any of the user-agents below
- Specific platform theme 1 by user-agent: mobile
 - This theme will be used for all users with a browser matching the user-agents below
- User agents for theme 1: Android
 - This list (one string per line) will be check against the users' user-agents, using Perl-syntax regular expressions (case-insensitive, accepting .*, between others).

The settings to be added:

```
INSERT INTO settings_current
```

```
(variable, subkey, type, category, selected_value, title, comment, scope, subkeytext, access_url_changeable)
```

```
VALUES
```

```
('template_default', NULL, 'textfield','stylesheets','default','SettingDefaultTemplateTitle','SettingDefaultTemplateComment', NULL, NULL, 1),
```

```
('template_var1', NULL, 'textfield','stylesheets','','SettingTemplate1Title','SettingTemplate1Comment', NULL, NULL, 1),
```

```
('template_var1_regexp', NULL, 'textarea','stylesheets','','SettingTemplate1RegexpTitle','SettingTemplate1RegexpComment', NULL, NULL, 1);
```
