Add session_id to track_e_default

...and update events::event_system() to accept a session_id, and coursemanager::unsubscribe_user() to call it if the unsubscription is in a session (currently, we have no tracking of that).

Fix previous commit to Event::addEvent() - introduced bug with course ID and session ID ~ refs #7202

I commented out the track_e_default rows deletion on course delete. This is slightly related to this task, although not the same point.

I also updated the addEvent() method to change course code to course ID. This should increase speed overall as otherwise a query was required each time to get the ID from the code in the course table.
Finally, I changed the events.lib.inc.php filename to events.lib.php (plus added lines to update-files-1.9.0-1.10.0.inc.php).

Tested in general and it works fine.
