#### Description

In the professional world, it is often desired to have the possibility to have regular peer assessment reviews.

This works like this:

- a teacher or manager selects a group of users
- she selects a desired number of reviews (e.g. each user has to be reviewed by at least 3 other people)
- she gives a series of questions (like in the surveys)
- the system randomly picks whom will have to review who
- the system sends an e-mail to each user asking to review colleagues
- the user follows the link and has to answer all questions about his colleagues
- the user also (optionally) has to answer these questions about himself
- the data is stored in the database
- charts are generated for each user, showing:
  - the average score from colleagues for each question (if the user himself sees it, he cannot see who scored him)
  - the score he gave himself
  - the score his manager gave him

These specifications have to be worked on a little, but I guess it would be relatively easy to re-use the surveys to do it.
